

Assignment 3 - data capturing

This is a service-learning exercise. You will have a chance to be a participant in the creation of a crowd sourced global GIS database intended to document the destruction of historical global heritage. It is an initiative of the United Nations Institute for Training and Research's Operational Satellite Applications Programme, called Geotag-X (<http://geotagx.org/>).

Please pick a project that interests you (for example The Yemeni Cultural Risk), and follow their instructions (very easy) to contribute at least 3 photos to this global database. Write a 150-200 words summary of what you did and of how you think this data was captured and stored in the main database. Include screen captures if you need.

Home assignments always due a week later .
